Free acids

*M*: Amount (g) of the test sample, calculated on the anhydrous basis

(2) Acetyl group—Weigh accurately about 0.1 g of Cellacefate, put in a glass-stoppered conical flask, add exactly 25 mL of 0.1 mol/L sodium hydroxide VS, and boil for 30 minutes under a reflux condenser. After cooling, add 5 drops of phenolphthalein TS, and titrate  $\langle 2.50 \rangle$  with 0.1 mol/L hydrochloric acid VS. Perform a blank determination.

- Content (%) of free acids and bound acetyl group (C<sub>2</sub>H<sub>3</sub>O) = 0.4305A/M
  - A: Amount (mL) of 0.1 mol/L sodium hydroxide VS consumed, corrected by the blank determination
  - M: Amount (g) of the test sample, calculated on the anhydrous basis

Content (%) of acetyl group (C<sub>2</sub>H<sub>3</sub>O) =  $100 \times (P - 0.5182B)/(100 - B) - 0.5772C$ 

- B: Amount (%) of free acids obtained in the Purity (2) Free acids
- C: Content (%) of carboxybenzoyl group
- *P*: Content (%) of free acids and bound acetyl group  $(C_2H_3O)$

Containers and storage Containers—Tight containers.

## **Microcrystalline Cellulose**

結晶セルロース

[9004-34-6, cellulose]

This monograph is harmonized with the European Pharmacopoeia and the U.S. Pharmacopeia. The parts of the text that are not harmonized are marked with symbols ( $\bullet$  ).

Microcrystalline Cellulose is purified, partially depolymerized  $\alpha$ -cellulose, obtained as a pulp from fibrous plant material, with mineral acids.

•The label indicates the mean degree of polymerization, loss on drying, and bulk density values with the range.  $\blacklozenge$ 

\***Description** Microcrystalline Cellulose occurs as a white crystalline powder having fluidity.

It is practically insoluble in water, in ethanol (95) and in diethyl ether.

It swells with sodium hydroxide TS on heating.

**Identification** (1) Dissolve 20 g of zinc chloride and 6.5 g of potassium iodide in 10.5 mL of water, add 0.5 g of iodine, and shake for 15 minutes. Place about 10 mg of Microcrystalline Cellulose on a watch glass, and disperse in 2 mL of this solution: the substance develops a blue-violet color.

•(2) Sieve 20 g of Microcrystalline Cellulose for 5 minutes on an air-jet sieve equipped with a screen (No.391, 200 mm in inside diameter) having  $38 - \mu m$  openings. If more than 5% is retained on the screen, mix 30 g of Microcrystalline Cellulose with 270 mL of water; otherwise, mix 45 g with 255 mL of water. Perform the mixing for 5 minutes in a high-speed (18,000 revolutions per minute or more) power blender. Transfer 100 mL of the dispersion to a 100-mL graduated cylinder, and allow to stand for 3 hours: a white, opaque, bubble-free dispersion, which does not form a supernatant liquid at the surface, is obtained. $\bullet$ 

(3) Transfer 1.3 g of Microcrystalline Cellulose, accurately weighed, to a 125-mL conical flask, and add exactly 25 mL each of water and 1 mol/L cupriethylenediamine TS. Immediately purge the solution with nitrogen, insert the stopper, and shake on a suitable mechanical shaker to dissolve. Perform the test with a suitable amount of this solution, taken exactly, according to Method 1 under Viscosity Determination  $\langle 2.53 \rangle$  using a capillary viscometer having the viscosity constant (*K*) of approximately 0.03, at  $25 \pm 0.1$  °C, and determine the kinematic viscosity,  $\nu$ . Separately, perform the test with a mixture of exactly 25 mL each of water and 1 mol/L cupriethylenediamine TS in the same manner as above, using a capillary viscometer having *K* of approximately 0.01, and determine the kinematic viscosity,  $\nu_0$ .

Calculate the relative viscosity,  $\eta_{rel}$ , of Microcrystalline Cellulose by the formula:

$$\eta_{\rm rel} = v/v_{\rm o}$$

Obtain the product,  $[\eta]C$ , of intrinsic viscosity  $[\eta](mL/g)$ and concentration C (g/100 mL) from the value  $\eta_{rel}$  of the Table. When calculate the degree of polymerization, P, by the following formula, P is not more than 350  $\diamond$  and within the labeled range. $\diamond$ 

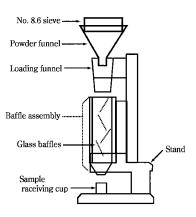

$$P = (95)[\eta]C/M_{\rm T}$$

 $M_{\rm T}$ : Amount (g) of the sample, calculated on the dried basis

**pH**  $\langle 2.54 \rangle$  Shake 5.0 g of Microcrystalline Cellulose with 40 mL of water for 20 minutes, and centrifuge: the pH of the supernatant liquid is between 5.0 and 7.5.

**Purity** (1) Heavy metals (1.07)—Proceed with 2.0 g of Microcrystalline Cellulose according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(2) Water-soluble substances—Shake 5.0 g of Microcrystalline Cellulose with 80 mL of water for 10 minutes, filter with the aid of vacuum through a filter paper for quantitative analysis (5C) into a vacuum flask. Evaporate the clear filtrate in a tared evaporating dish to dryness without charring, dry at  $105^{\circ}$ C for 1 hour, cool in a desiccator, and weigh: the difference between the mass of the residue and the

JP XVI

mass obtained from a blank determination does not exceed 12.5 mg.

(3) Diethyl ether-soluble substances—Place 10.0 g of Microcrystalline Cellulose in a column having an internal diameter of about 20 mm, and pass 50 mL of peroxide-free diethyl ether through the column. Evaporate the eluate to dryness in a previously dried and tared evaporation dish.

Dry the residue at  $105^{\circ}$ C for 30 minutes, allow to cool in a desiccator, and weigh: the difference between the mass of the residue and the mass obtained from a blank determination does not exceed 5.0 mg.

**Conductivity** <2.51> Perform the test as directed in the Conductivity Measurement with the supernatant liquid ob-

Table for Conversion of Relative Viscosity ( $\eta_{rel}$ ) into the Product of Limiting Viscosity and Concentration ([ $\eta$ ]C)

|              | $[\eta]C$ |       |       |       |       |       |       |       |       |       |

## 602 **Powdered Cellulose** / Official Monographs

receiving cup mounted directly below it.

(ii) Procedure—Weigh accurately the mass of a brass or stainless steel cup, which has a capacity of  $25.0 \pm 0.05$  mL and an inside diameter of  $30.0 \pm 2.0$  mm, and put the cup directly below the funnel of the volumeter. Slowly pour Microcrystalline Cellulose 5.1 cm height from the upper part of the powder funnel through the sieve, at a rate suitable to prevent clogging, until the cup overflows. If the clogging occurs, take out the sieve. Level the excess powder with the aid of a slide glass, weigh the filled cup, and weigh accurately the content of the cup, and then calculate the bulk density by the following expression: the bulk density is within the labeled specification.

Bulk density  $(g/cm^3) = A/25$ 

A: Measured mass (g) of the content of the cup

•Microbial limit  $\langle 4.05 \rangle$  The acceptance criteria of TAMC and TYMC are 10<sup>3</sup> CFU/g and 10<sup>2</sup> CFU/g, respectively. *Escherichia coli, Salmonella, Pseudomonas aeruginosa* and *Staphylococcus aureus* are not observed.

## **Powdered Cellulose**

粉末セルロース

[9004-34-6, Cellulose]

This monograph is harmonized with the European Pharmacopoeia and the U.S. Pharmacopeia. The parts of the text that are not harmonized are marked with symbols ( $\bullet$  ).

Powdered Cellulose is a purified, mechanically disintegrated alpha cellulose obtained as a pulp,  $\bullet$ after partial hydrolysis as occasion demands, from fibrous plant materials.

The label indicates the mean degree of polymerization value with a range.

•Description Powdered Cellulose occurs as a white powder.

It is practically insoluble in water, in ethanol (95) and in diethyl ether.  $\bullet$ 

**Identification (1)** Dissolve 20 g of zinc chloride and 6.5 g of potassium iodide in 10.5 mL of water, add 0.5 g of iodine, and shake for 15 minutes. Place about 10 mg of Powdered Cellulose on a watch glass, and disperse in 2 mL of this solution: the substance develops a blue-violet color.

•(2) Mix 30 g of Powdered Cellulose with 270 mL of water in a high-speed (18,000 revolutions per minute or more) blender for 5 minutes, transfer 100 mL of the dispersion to a 100-mL graduated cylinder, and allow to stand for 1 hour: a supernatant liquid appears above the layer of the cellulose.

(3) Transfer 0.25 g of Powdered Cellulose, accurately weighed, to a 125-mL conical flask, add exactly 25 mL each of water and 1 mol/L cupriethylenediamine TS, and proceed as directed in the Identification (3) under Microcrystalline Cellulose. The mean degree of polymerization, P, is not less than 440 and is within the labeled specification.

**pH**  $\langle 2.54 \rangle$  Mix 10 g of Powdered Cellulose with 90 mL of water, and allow to stand for 1 hour with occasional stirring: the pH of the supernatant liquid is between 5.0 and 7.5.

**Purity** (1) Heavy metals (1.07)—Proceed with 2.0 g of Powdered Cellulose according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(2) Water-soluble substances—Shake 6.0 g of Powdered Cellulose with 90 mL of recently boiled and cooled water, and allow to stand for 10 minutes with occasional shaking. Filter, with the aid of vacuum through a filter paper, discard the first 10 mL of the filtrate, and pass the subsequent filtrate through the same filter, if necessary, to obtain a clear filtrate. Evaporate a 15.0-mL portion of the filtrate in a tared evaporating dish to dryness without charring, dry at  $105^{\circ}$ C for 1 hour, and weigh after allowing to cool in a desiccator: the difference between the mass of the residue and the mass obtained from a blank determination does not exceed 15.0 mg.

(3) Diethyl ether-soluble substances—Place 10.0 g of Powdered Cellulose in a column having an internal diameter of about 20 mm, and pass 50 mL of peroxide-free diethyl ether through the column. Evaporate the eluate to dryness in a previously dried and tared evaporation dish. Dry the residue at  $105 \,^{\circ}$ C for 30 minutes, and weigh after allowing to cool in a desiccator: the difference between the mass of the residue and the mass obtained from a blank determination does not exceed 15.0 mg (0.15%).

Loss on drying  $\langle 2.41 \rangle$  Not more than 6.5% (1 g, 105°C, 3 hours).

**Residue on ignition**  $\langle 2.44 \rangle$  Not more than 0.3% (1 g calculated on the dried basis).

•Microbial limit  $\langle 4.05 \rangle$  The acceptance criteria of TAMC and TYMC are 10<sup>3</sup> CFU/g and 10<sup>2</sup> CFU/g, respectively. *Escherichia coli, Salmonella, Pseudomonas aeruginosa* and *Staphylococcus aureus* are not observed.

The desired product of Celmoleukin (Genetical Recombination) is a protein consisting of 133 amino acid residues manufactured by *E. coli* through expression of human interleukin-2 cDNA.

It is a solution having a T-lymphocyte activating effect.

It contains not less than 0.5 and not more than 1.5
